

Acn4  
armature, and wherein a driving force from the armature is transmitted to the contacts via the drive member.

---

5. (Amended-Clean Text) The high frequency relay according to claim 1, wherein the pair of shielding members are joined together by an electrically conductive adhesive.

6. (Amended-Clean Text) The high frequency relay according to claim 1, further comprising contact support members for supporting the contacts in an insulated state and support members for supporting the contact support members to allow the contact support members to deflect in a direction perpendicular to the contact surfaces, wherein one of the pair of shielding members has insertion holes defined therein into which the contact support members are inserted, and wherein the support members have metallic shielding portions at locations corresponding to the insertion holes.

7. (Amended-Clean Text) The high frequency relay according to claim 1, further comprising contact support members made of an insulating material for supporting the contacts and support members for supporting the contact support members to allow the contact support members to deflect in a direction perpendicular to the contact surfaces, wherein the support members have

respective metallic support portions connected to one of the pair of shielding members.

8. (Amended-Clean Text) The high frequency relay according to claim 1, wherein the mounting surface is an external surface of one of the pair of shielding members.

9. (Amended-Clean Text) The high frequency relay according to claim 1, further comprising a casing wherein distal ends of the stationary terminals are positioned inside the casing.

10. (Amended-Clean Text) The high frequency relay according to claim 1, further comprising contact support members for supporting the contacts in an insulated state wherein the contact support members support the contacts in a direction substantially parallel to the mounting surface.

11. (Amended-Clean Text) The high frequency relay according to claim 1, wherein the pair of shielding members are formed into a desired shape by metal-injection molding.

12. (Amended-Clean Text) The high frequency relay according to claim 1, wherein the pair of shielding members are joined together by laser welding.

13. (Amended-Clean Text) The high frequency relay according to claim 1, wherein the stationary terminals comprise coil terminals connected to the coil, normally-closed stationary terminals, normally open stationary terminals pairing with the normally-closed stationary terminals, common stationary terminals connectable to either the normally-closed stationary terminals or the normally open stationary terminals, and wherein the normally-closed stationary terminal, the coil terminal, the common stationary terminal, the coil terminal, the normally open stationary terminal, the normally open stationary terminal, the coil terminal, the common stationary terminal, the coil terminal, and the normally-closed stationary terminal are arranged around one of the pair of shielding members in this order.

REMARKS

By the above amendment, the claims have been amended to delete multiple dependency.
